How to Build a Resume Chat Feature Like ChatGPT?

1. **Recap**
   - Review the LangGraph concepts learned so far.
   - The main idea is to use **LangGraph to build a stateful AI workflow**.
   - The project will combine previous concepts such as:
     - State
     - Nodes
     - Edges
     - LLM calls
     - Persistence/memory
     - Streaming
   - Goal: build a chatbot that can understand and answer questions about a **resume**.

2. **Resume Demo**
   - The demo shows a **ChatGPT-like interface for a resume**.
   - The user can upload/provide a resume and then ask questions about it.
   - Example questions:
     - "What are my technical skills?"
     - "Summarize my experience."
     - "What projects have I worked on?"
     - "What programming languages do I know?"
   - The AI answers using information from the resume.
   - The conversation can continue with follow-up questions while maintaining context.

Basic flow:

Resume → AI understands resume → User asks question → AI answers from resume

3. **Break Down of the Features**

The application is divided into several important features:

- **Resume input**
  - The system receives the resume as the source of information.
- **Resume understanding**
  - The AI processes the resume so it can answer questions about its content.
- **Chat interface**
  - Provides a conversational interface similar to ChatGPT.
- **Conversation memory**
  - Previous messages are maintained so follow-up questions make sense.
  - Example:
    - User: "What projects did I work on?"

        - User: “Which one used Python?”
    - The second question depends on the previous conversation.
- **LangGraph workflow**
    - LangGraph manages how the conversation moves through different processing steps.
- **State management**
    - The current conversation and relevant information are stored in the graph's state.
- **Streaming**
    - The response can be displayed progressively instead of waiting for the complete answer.

Overall architecture:

Resume → Processing → LangGraph State → LLM → Response and for conversation: User Question → State → LLM → Answer → Updated State

4. **Final Demo**
    - The completed Resume Chat application is demonstrated.
    - It behaves similarly to a basic ChatGPT conversation.
    - The user can ask multiple questions about the resume.
    - The system maintains the conversation context.
    - The final application combines multiple LangGraph concepts learned throughout the course.

5. **Task for You**
    - Build your own **Resume Chat application**.
    - Try to reproduce the main functionality shown in the demo.
    - Important concepts to practice:
        - LangGraph
        - State
        - Nodes and edges
        - LLM integration
        - Persistence/memory
        - Streaming
        - Chat UI

Key Takeaway

A **Resume Chat** is essentially a conversational AI system where the resume becomes the source of information:

Resume + Conversation State + LLM + LangGraph → ChatGPT-like Resume Assistant
